/clone lib="NCI CGAP EDI"
/clone lib="NCI CGAP EDI"
/clone lib="NCI CGAP EDI"
/note="Organ: Left Pubic Bone; Vector: pT7T3-Pac
/phrancial with a modified polylinker; Site_1: EcoR I;
Site_2: Not I; NCI CGAP EDI is a normalized cDNA library
containing the following tissue(s): Chondrosarcoma cell
line CSS: The library was constructed according to Bonaldo
.Lemnon and Soares, Genome Research, 6:791-806, 1996.
First strand cDNA synthesis was primed with an oligo-dT
primer containing a Not I site. Double stranded cDNA was
ligated to an EcoR I adaptor, digested with Not I, and
cloned directionally into pT7T7-Pac vector: The
oligonicleotide used to prime the synthesis of
first-strand cDNA contains a library tag sequence that is
located between the Not I site and the (dT)18 tail. The
sequence tag for this library is GCTCRAGGCT:
TAG LIB=UI-H-EDI
TAG TISSUE=chondrosarcoma
TAG SESC-CGTCAGGCT"

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A Geneseq 19Jun03:*

INST CANCER RES

transgenic animal; platelet derived growth factor C; PDGF-C;

cardiac hypertrophy; fibrosis.

platelet-derived growth factor (PDGF-C) protein.

Human

```
The present sequence represents human platelet-derived growth factor (PDGF-C) (formally designated VEGF-F). PDGF-C polypeptides have the ability to stimulate and enhance proliferation or differentiation, and/or growth or motility of cells expressing a PDGF-C receptor.

DGF-C polypeptides can be used in pharmaceuticals for promoting cell proliferation, preferably in combination with one other growth factor and heparin. Pharmaceuticals comprising PDGF-C polypeptides can also be used for stimulating connective tissue or wound healing. The puge C polypeptide can be enzymatically processed to generate the active truncated form of PDGF-C and used to regulate the receptor-binding specificity of PDGF-C and also be used to promote fibroblast mitogenesis in a mammal and to induce PDGF alpha receptor activation.

Expressing PDGF-C in a mammal. Specific types of human tumours, e.g. choricarcinoma, Wilms tumour, megakaryoblastic leukaemia, lung carcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and erythroleukemia, can be identified by testing for expression of PDGF-C. PDGF-C antagonists can also be used to inhibit tissue remodelling during invasion of tumour cells into a normal population of cells. Antagonists can also be used to treat fibrotic conditions, especially found in the lung, kidney or liver.
                                                                                                                                                             Novel DNA encoding PDGF-C useful to stimulate or enhance proliferation, differentiation, growth and motility of cells expressing the PDGF-C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
```

The patent discloses a method for producing a transgenic, non-human animal over-expressing a platelet derived growth factor C (PDGF-C), or its functional fragment or analogue. The method involves introducing a transgenic PDGF-C DM into a cell of a non-human animal, introducing the cell into a non-human animal and allowing the cell to develop into a managenic, non-human animal. The transgenic animal is useful as a model to study disease tattes characterised by over-expression of PDGF-C and to find therapy for those diseases, particularly hypertrophy and interior in various organs including the heart. The present sequence

is PDGF-C protein from human.

A transgenic animal over-expressing platelet derived growth factor C useful to study and find therapy for disease associated with PDGF-C over-expression, including cardiac hypertrophy and fibrosis

                                                                                                                                                                                                                                                                ઢ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes the isolation of a novel human vascular endothelial cell growth factor-E (VEGF-E) polypeptide which has tranquillizer, vulnery and cardiant activity. VEGF-E can be administered therapeutically, especially by expressing encoding polynucleotides, to treat cardiovascular or endothelial disorders in mammals, especially by mammals. Especially by expressing encoding polynucleotides, to treat cardiovascular or endothelial disorders in mammals, especially can be used to treat cardiac hypertrophy contact or treat angiogenic treat angiogenic treat angiogenic disorders in mammals (especially humans) e.g. cancer or screen for antagonists and agonists, and the antagonists administered to carteat angiogenic disorders in mammals (especially humans) e.g. cancer or segent therapeutically as antagonists, as above. VEGF-E can be used to generate antibodies, useful therapeutically as antagonists, as above. The antibodies are also useful therapeutically as antagonists, as above. The antibodies are also cardiovascular, endothelial or angiogenic disorders in mammals (e.g. vascular disease, or neovascularization associated with tumor formation) by contacting the antibody with a tissue sample and detecting formation. WEGF-E can be used to diagnose cardiovascular and endothelial disorders in mammals, by detecting abnormally high or low VEGF-E gene expression in tissue samples. They can also be used to disquose a disease or susceptibility to a disease related to a mutated form of VEGF-E can a mutation in the VEGF-E-encoding sequence isolated from a sample. They may also be used to produce probes useful to detect related sequences or for gene mapping. This sequence probes useful to detect related sequences or for gene mapping. This invention.

The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AA233891 to AA234338, and AAY41685 to AA441774 represent polynucleotide and polypeptide sequence given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GRWCGSGTVPGKQISKGNQIRIRFVSDEYFPSEPGFCIHYNIVMPQFTEAVSPSVLPPSA

                                                                                                                                         The present sequence represents a vascular endothelial growth factor related (WBGF-R) protein. VBGF-R can be used in assays to identify compounds that bind to it or that annagonize its activity. VBGF-R antagonists (e.g. anti-VBGF-R antibodies) are useful for inhibiting tissue growth. This is useful for inhibiting tumour growth and for treating cancer. VBGF-R itself can be used to stimulate tissue growth, anglogenesis and to treat coronary artery blockage. The VBGF-R coding sequence can be used for the recombinant production of the VBGF-R protein.
                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                        growth factor related protein and related for identifying antagonists and binding

The invention relates to the human growth factor homologue zvegf4

(AAB48653), and nucleic acids encoding it (AAC81555). Zvegf4 is a member

of the PDGF (platelet-derived growth factor)/VBGF (vascular endothelial

growth factor) family. Zvegf4 has a growth factor domain (AAB48654)

contracterised by a PDGF cystine knot structure, and a CUB domain

contracterised by a PDGF cystine knot structure, zvegf4 has PDGF-like

activity, having mitogenic activity on fibroblasts, vascular smooth

contracted the same period activity on fibroblasts, vascular smooth

contracted acids, the recombinant expression of human zvegf4/human zvegf4

contracted acids, the recombinant expression of human zvegf4/human zvegf4 or fragments thereof, particularly human zvegf4/human zvegf4 or a fragment thereof; a method of activating

contracted acids, the recombinant expression of human zvegf4, an antibody

contracted acids, the recombinant expression of human zvegf4, an antibody

contracted acids, the recombinant expression of human zvegf4, an antibody

contracted acids, the receptor using a zvegf4-derived polypeptide; a

cell-surface PDGF receptor using a zvegf4-derived polypeptide; a

cell-surface PDGF receptor using a zvegf4-derived polypeptide; a

confliction of modulating the proliferation, differentiation, migration or

confliction of modulating the proliferation. They are particularly used for

conflicting the properties; and a method of detecting a genetic

collular differentiation or proliferation. They are particularly used for

collular differentiation or proliferation. They are particularly used for

collular differentiation or proliferation or modulate neuritie growth (e.g., in the treatment of periodontal disease and fractures. They may be used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method for enhancing tissue growth, promoting wound healing or stimulating smooth muscle growth by administering a platelet-derived growth factor (PDGF) related protein, designated LPB or its analogue. Also described is a method of slowing the progress of atherosclerosis or treating atherosclerosis comprising the administration of an LPB antagonist. The method is useful for enhancing tissue growth, promoting wound healing and stimulating smooth muscle growth. Antagonists of LPB are useful for treating atherosclerosis. The present sequence represents human LPB, which is

activity. The polynucleotides and polypeptides can be used for detecting molecules to RRO polypeptides in samples, for linking bioactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting targeting the polypeptide target cells, e.g. for the treatment of cancers. The polypeptide pairs provide specific targeting of bioactive molecules to cells. AAC78600 to AAC7807 represent PCR primers and probes used in the isolation of the PRO polynucleotide sequences.

This invention describes a novel vascular endothelial growth factor-X (VBGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antirheumatic, antiarthritic, antipporiatic and antidiabetic activity and acts as an anglogenesis and vascularization cautidiabetic activity and acts as an anglogenesis and vascularization of requirementary career, rheumatoid arthritis, psoriasts and diabetic retinopathy by inhibiting anglogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote SKAIN graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair, proliferation of new blood vessels, tissue regeneration. This sequence represents the RACE generated human VEGF-X protein described in the method of the invention.

This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polymucleotide (IIa) which has vulnerary, cytostatic, antiheumatic, antiarthritic, antipsoriatic and antidiabetic activity and acts as an angiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood and tissue repeneration and organ and tissue repeneration and organ and tissue repeneration and organ for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  240

The first invertible and its encoding polymucleotide [IIa] which has valuerary, cytostatic, antirheumatic, antiarthitic, antiposciatic and antidabetic activity and acts as an angiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products of the invention are useful can treparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair propries and purns and to promote skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair by promoting angiogenic activity or vascularization. This sequence represents a human VEGF-X protein
                                                                                                                                                                                                                                              VEGF-X; vascular endothelial growth factor; human; vulnerary; cytostatic; antirheumatic; antiarthritic; antipsoriatic; antidiabetic; treatment; andiogenesis regulator; vascularization regulator; cancer; psoriasis; rheumatoid arthritis; diabetic retinopathy; blood vessel; organ repair; tissue regeneration; tissue repair; wound; dermal ulcer; pressure sore; venous sore; diabetic ulcer; burns; skin graft growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New vascular endothelial growth factor protein, useful for treating or preventing diseases associated with inappropriate angiogenesis activity such as cancer, rheumatoid arthritis, psoriasis and wounds -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 MSLFGLLLVTSALAGORRGTQAESNLSSKFQFSSNKEQNGVQDPQHERIITVSTNGSIHS

An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic estinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products of the invention are useful

for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair by promoting angiogenic activity or vascularization. This sequence represents the human 990126vegx protein used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                   9

This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antirheumatic, antiarthritic, antigoriatic and antidiabetic activity and acts as an anglogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting anglogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ at the state growth, as subject. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote skin graff growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair, proliferation of new blood vessels, tissue regeneration and organ repair by promoting angiogenic activity or vascularization. This sequence represents the human VEGF-X protein
                                                         preventing diseases associated with inappropriate angiogenesis activity such as cancer, rheumatoid arthritis, psoriasis and wounds -
                           growth factor protein, useful for treating
                                                                                                                                          Claim 72; Fig 12; 127pp; English.

uveitis

The present sequence is that of human PRO200 or vascular endothelial growth factor E (VEGF-E), as predicted from a cDNA clone (see AAA88515) that was isolated from a glioma cell line G61.

Clone (see AAA88515) that showed homology to VEGF. PRO200 has a predicted mol.wt. of 39,029 and a pl of about 6.06. A method for producing PRO polypeptides, including PRO200, using a host cell transformed with a vector comprising a PRO nucleic acid is claimed. The invention relates to the use of PRO polypeptides to delay, the invention relates to the use of PRO polypeptides to delay. The invention relates to the use of PRO polypeptides to delay, prevent or rescue retinal cells such as retinal neurons selected from photoreceptors, retinal ganglion cells, displaced retinal again or cells, amarcine cells, displaced amacrine cells, including Mueller cells and pipolar neurons, and supportive cells (including Mueller cells and pipolar neurons, and supportive cells (including Mueller cells and cells are preferably photoreceptors and aphotoreceptor cell injury or by an ocular disease selected from retinal detachment, retinal cells including age-related, retinal decamental reamma or by an ocular disease selected from retinal decamental retinal degenerative myopia, acute retinal neorosis syndrome, traumatic chorioretinopathies or contusion such as Purtscher's retinopathy, celmal injury, lagin or conditions such as central or branch retinal vision collagen vascular alseases, thrombocyclopenic purpura, uveits, retinal vasculitis and occlusion associated with Eales

The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for treating and disgnosing immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, systemic solerosis, idiopathic inflammatory myopathies, systemic vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central and peripheral nervous systems, hepatobiliary diseases of the central and peripheral nervous systems, demyelinating diseases of the central control disease, gluten-sensitive enteropathy and whipple's disease, immunological diseases of the lung, and transplantation associated diseases including graft rejection and graft-versus-host-disease.

MACSB397 to AACSB398 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AACSB599 to AACSB642 and AABB34414 to AAASB477 represent human PRO polynucleotide and protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sixty four PRO polypeptides, useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosis, rheumatoid arthritis, osteoarthritis, thyroiditis and diabetes mellitus
